COMMISSION OF THE EUROPEAN COMMUNITIES

COM(83) 481 final

Brussels, 25th July 1983

REPORT

COMMISSION EXPERT GROUP ON METHODOLOGY IN THE DISTRIBUTION
OF THE NORTH SEA HERRING STOCK

COM(83) 481 final

EXPLANATORY MEMORANDUM

This report was produced by the Commission expert Group on methodology in the distribution of the North Sea herring stock in response to the terms of reference agreed at the Council of 11-12 July 1983.

COMMISSION EXPERT GROUP ON METHODOLOGY IN THE DISTRIBUTION OF

THE NOTRH SEA HERRING STOCK

1. TERMS OF REFERENCE

To consider, using the criteria for distribution underlying art. 4 of Regulation n° 170/83 of 25 January 1983, a theoretical distribution of the North Sea herring stock for human consumption.

To examine the question of reaching such a distribution in function of the recovery of the stock.

To consider the factors affecting the division of resultant quotas between sub-zones IVa, IVb and IVc.

2. MEETINGS

The group met on 15 July 1983 and on 20 July 1983.

3. PARTICIPANTS

4. PROCEDURE

The group agreed firstly, to examine the manner in which each of the criteria of 30 May 1980 should be used in any model and secondly to determine the model. Subsequently, the model would be used to calculate theoretical distributions as a function of the recovery of the stock. The factors affecting the division of the resultant quotas between divisions IVa, IVb and IVc, VIId would then be examined.

5. CATCH STATISTICS

Calculations should be based on a published set of catch statistics.

Those published in ICES Cooperative Research No. 60 (Appendix Tables 4 to 8 and ICES Documents CM 1979/H : 6 (Tables 2.3 - 2.7) and CM 1980/H: 4 (Tables 3.1 and 3.2) are the most appropriate because :

1. catch statistics are available for the four relevant ICES divisions IVa, IVb and IVc, VIId; (those for divisions IVa and IVb are available separately : those for IVc and VIId are combined and are not available separately).
2. The catches of adult herring and of young herring are shown separately. It was noted that, for some Member States, the separation of catches between divisions was probably based on estimates and not on actual catch statistics.

The official statistics published by EUROSTAT and in the ICES Bulletins Statistiques do not give catches by ICES divisions for all Member States and they provide only total catches, irrespective of the type of fishery.

It was agreed that catches of young herring should not be included in calculating traditional fishing because they were caught in a directed fishery for reduction to meal and oil. All catches of adult herring should be included. There is no objective method of distinguishing adult herring caught directly for reduction to meal and oil from herring caught for human consumption and sold for reduction as a result of lack of market demand at the time of landing.

Catch statistics for the North Sea are given in Annexes I to IV.

. / ...

6. PERIOD FOR CALCULATING TRADITIONAL FISHING

There was no agreement upon the period which should be used. The period 1973-78 was generally considered inappropriate for North Sea herring because the stock was collapsing during 1973-76 and in 1977-78 the fisheries were closed.

A longer period was thought more appropriate but there was no agreement as to what it should be.

Suggestions included : 1960 - 1969

1950 - 1976

1950 - 1969

1967 - 1976

1973 - 1976

10 year period for each Member State in which its catches were highest.

7. HAGUE PREFERENCE

There was discussion as to whether the Hague Preference should be included in the model, or only allowed to a limited extent, because the herring fishery was no longer a coastal fishery for whose benefit Hague Preferences had been intended. However, Annex VI of the Hague Agreement refers to areas where the local communities are particularly dependent upon fishing and the industries allied thereto without specifying the areas in which these communities fish. (Council Document R/2227/76 (AGRI 644) (RELEX 36).

The Hague Preference does not benefit the UK at an EC share of the TAC greater than approximately 200.000 t.

8. JURISDICTIONAL LOSSES

Jurisdictional Losses should be limited to losses in the NAFO area because it is unlikely that the Community will ever have catch possibilities for herring in the future and therefore these losses can be specifically quantified.

Losses should be equalised following the method described in document SEC (82)930 of 11.6.82, using the historic base period for the North Sea.

The following method of treating Jurisdictional Losses was decided :

1. the maximum compensation should be 60 % similar to the level agreed in the settlement of 25 January 1983 for other stocks;
2. the maximum compensation should be given at a TAC of 400.000 t (see paragraph 11);
3. below this level, compensation should be given in proportion to the EC share of the TAC : for example 50 % when the EC share was 200.000 t.

The period for calculating Jurisdictional Losses is the same as that used for calculating traditional fishing, i.e. 1960-1976.

9. STOCKS

There were opposing views as to whether the North Sea herring stock should be considered as a single unit for the purposes of the model, as stated in the terms of reference, or as three separate stocks.

There was a general concensus that the quota allocation for other stocks of herring had been decided by the agreement of the 25 January 1983 and that any model should refer only to North Sea herring without considering any other herring stocks.

10. THE MODEL

Calculations were made on the basis of the model described in document SEC(82)930 of 11.06.1982 modified in the light of the discussions of the group.

Jurisdictional Losses were calculated using the method described in Paragraph 8.

. / ...

11. DISTRIBUTION OF QUOTAS AS A FUNCTION OF THE RECOVERY OF THE STOCK

The best method by which to determine this distribution would be to calculate, using the model, the allocations which would result at various levels of TACs.

Because the historic market for human consumption purposes was 400.000 t, it was proposed that this should be the maximum TAC for which allocations should be calculated and that, once this level of TAC occurred, a new model might be appropriate.

12. DIVISION OF RESULTANT QUOTAS BETWEEN ICES DIVISIONS IVa, IVb and IVc, VIId.

It was agreed that, if the resultant quotas had to be divided between divisions, they should be divided in the ratio of the average catches in each division by each Member State during the period selected for calculating traditional fishing within the limits of the TAC. Transfers to other divisions should be made if required to avoid exceeding the TAC. Some members of the group thought it would be better not to divide the quotas by divisions, even if the scientific advice continued to be given in this manner.

13. SUMMARY RESULTS

Results are given in Annexes V to IX.

They are based on the following :

1. Traditional fishing : average of catches 1960-76 : ACFM statistics excluding young herring.
2. Hague Preference (UK) : 13.170 t.
3. NAFO Jurisdictional Losses : base period 1960-76.
